For:	TV Signal Receiving Tuner Capable of Outputting Oscillation Signal Having Wide Frequency Band by Means of Single Local Oscillator	

PRELIMINARY AMENDMENT

Commissioner for Patents Washington, D.C. 20231

Dear Sir:

Prior to examination of the above-identified application, please amend the application as follows:

In the Claims

Please rewrite Claims 1-4, 6-16, and 18-27 as follows:

- 1. (Amended) A TV signal receiving tuner for receiving TV signals by dividing the TV signals into a plurality of frequency bands, comprising:
- a local oscillator which oscillates at a frequency range corresponding to a received TV signal having a predetermined frequency band;
- a first programmable divider which receives a local oscillation signal of the local oscillator and divides the local oscillation signal; and
- a first mixer which mixes the received TV signal and an output of the first programmable divider and frequency converts the received TV signal into an intermediate-frequency signal having a predetermined frequency, wherein

a dividing rate of the first programmable divider is variable and set to 1 to receive a TV signal having a first frequency band and to at most 1/2 to receive a TV signal having a second frequency band, the second frequency band being lower than the first frequency band.

2. (Amended) A TV signal receiving tuner for receiving TV signals by dividing them into a plurality of frequency bands, comprising:

a local oscillator which oscillates at a frequency range corresponding to a received TV signal having a predetermined frequency band;

a second programmable divider which receives a local oscillation signal of the local oscillator and divides the local oscillation signal;

a second mixer which mixes the received TV signal and the local oscillation signal and frequency converts the received TV signal into an intermediate-frequency signal having a first frequency; and

a third mixer which mixes the received TV signal and an output of the second programmable divider and frequency converts the received TV signal into an intermediate-frequency signal having a second frequency,

wherein frequency conversion is carried out by the second mixer to receive a TV signal having a first frequency band, and

wherein frequency conversion is carried out by the third mixer to receive a TV signal having a frequency band lower than the first frequency band.

- 3. (Amended) The TV receiving tuner according to claim 2, wherein a dividing rate of the second programmable divider is variable and dependent upon a geographical location in which the TV receiving tuner is disposed.
- 4. (Amended) The TV receiving tuner according to claim 1, further comprising:

a first tracking filter to select the TV signal having the first frequency band;

a second tracking filter to select the TV signal having the second frequency band arranged in parallel to the first tracking filter; and

a PLL IC to output a tuning voltage that changes a frequency of the local oscillation signal output from the local oscillator,

wherein the tuning voltage is applied to the first tracking filter and the second tracking filter to tune a pass band of one of the first tracking filter and the second tracking filter to a frequency of the TV signal to be received.

6. (Amended) The TV receiving tuner according to claim 5, further comprising:

a low-noise first preamplifier having an automatic gain control (AGC) function provided after the first tracking filter; and

a low-noise second preamplifier having an AGC function provided after the second tracking filter.

7. (Amended) The TV receiving tuner according to claim 6, further comprising:

a first image trap circuit to attenuate an image frequency signal corresponding to the TV signal to be received interposed between the first preamplifier and the second mixer; and

a second image trap circuit to attenuate the image frequency signal corresponding to the TV signal to be received interposed between the second preamplifier and the third mixer.

- 8. (Amended) The TV receiving tuner according to claim 1, wherein the local oscillator outputs an oscillation signal having a frequency band of at least 847 to 505 MHz, and wherein the dividing rate of the first programmable divider may be set to different values including 1, 1/3 and 1/5.
- 9. (Amended) The TV receiving tuner according to claim 1, wherein the local oscillator outputs an oscillation signal having a frequency band of at least 803 to 473 MHz, and wherein the dividing rate of the first programmable divider may be set to different values including 1, 1/3 and 1/9.
- 10. (Amended) The TV receiving tuner according to claim 1, wherein the local oscillator outputs an oscillation signal having a frequency band of at least 824 to 530 MHz, and wherein the dividing rate of the first programmable divider may be set to different values including 1, 1/3 and 1/4.
